TECHNICAL SKILLS

TypeScript, JavaScript, React, React Native, Redux, Next.js, HTML, CSS, Tailwind CSS, Bootstrap, Node.js, Java, Python, C#, ASP.NET, SQL (PostgreSQL, MS SQL Server, BigQuery, NRQL), GraphQL, NoSQL, Prisma ORM, AWS (Amplify, RDS, Lambda, EventBridge, S3, CloudFront, SES, Route 53), Vercel, NextAuth, Stripe, Contentful, Vitest, GitHub Actions, Jest, Git, New Relic, Quantum Metric, Claude Code

EXPERIENCE

Niche-Social | ***niche-social.com*** |***Atlanta, GA*** | ***Lead Software Engineer*** **2026 - Present**

- Lead engineer building Niche, an Atlanta events marketplace with 75+ hosts and 100+ events, on a two-person engineering team. Owned the architecture, 41-model PostgreSQL schema (Prisma), and production infrastructure from the first commit.
- Led a zero-downtime production migration from Vercel and Neon to AWS (Amplify, RDS, Lambda, S3, CloudFront, SES), moving scheduled jobs to Lambda on EventBridge Scheduler to get past Amplify's 30-second request limit.
- Built an event-discovery pipeline that has sourced 600+ local events from Eventbrite and Partiful with radius filtering and admin-safe updates, plus an "add from link" tool that drafts listings from any event URL via schema.org with LLM fallback.
- Built Stripe ticketing (capacity limits, QR tickets, idempotent webhook fulfillment) and auth for admins, hosts, and guests: Google OAuth (NextAuth v5), email/password with verification, HMAC-signed sessions, and RBAC.
- Built the host dashboard (per-event analytics with UTM attribution, team roles, recurring event series, guest messaging), transactional email and an admin panel; covered core logic with 26 Vitest suites in GitHub Actions CI.

Home Depot | ***Atlanta, GA*** **2021 - 2026**

Software Engineer II

- Lead engineer on the Bundle Information Page (BIP), a new page type built from scratch that now serves **$1.3B in online bundled sales**. Led a ~15-person team of engineers and contractors through implementation, partnering with the staff engineer on overall architecture.
- Delivered four bundle experience types end-to-end: configuration layer, component orchestration, pricing/promo service integration, and responsive desktop/mobile rendering. Consolidated fragmented legacy bundle infrastructure into one architecture, eliminating **$1–2M/year** in operational overhead and speeding up new bundle launches.
- Shipped the BIP roadmap across multiple launches: MVP renderer for 66 combo SKUs, a new in-cart "Preset Bundle" promo type integrated with the pricing service, migration of 52 legacy kitchen packages, and bundle-aware PLP pods. Owned SEO markup, SSR hydration, cart/checkout API integration, and promo-stacking logic.
- Brought the team's React/TypeScript pages into the Home Depot iOS/Android app and drove mobile test parity with desktop in Jest: converted desktop test cases, fixed the React Native bugs they exposed, and wrote new mobile tests.
- Primary contributor on cross-sell/up-sell across 100,000+ SKUs, building swap-and-remove customization for add-on sales.
- First team to adopt audience-segmented beta releases (A/B/C cohorts), paired with GitHub Actions performance-regression checks, catching bugs or Core Web Vitals regressions in roughly **1 in 5 releases** before they reached production.
- Onboarded 10+ new hires, mentored a graduate of the Home Depot apprenticeship program, conducted technical interviews, and authored ADRs on traffic management, SEO, and Core Web Vitals strategy.

Software Engineer I

- Refactored an in-house calculator for 300,000+ SKUs across React and Java APIs, cutting bugs and extending it to more product categories, which increased bulk orders.
- Monthly release captain for the General Merchandise experience (**~80% of homedepot.com traffic**): ran code reviews, production/beta deployments with SREs, incident war rooms, and post-mortems.
- Refactored the React components for product variant selection and multi-product package displays, used by the majority of Home Depot's online products, for modularity and maintainability.
- Integrated Contentful CMS so PMs could change production content without a code deploy and releases could bump individual components instead of full builds; drove Tailwind adoption and a Node.js upgrade.

A Closer Look | ***Norcross, GA*** | ***Software Engineer*** **2019 - 2021**

- Migrated 20+ client and employee portal pages from ASP.NET to React and Redux, writing the C# ASP.NET Web API endpoints that served them JSON; cut page load time by 30%.
- Debugged and fixed legacy C#/ASP.NET pages; built a Node.js/SQL Server REST service, role-based access control, and a secure shopper sign-up flow; designed tables, triggers, and stored procedures.

EDUCATION

Georgia State University | ***BA in English, Concentration in Creative Writing*** **2016**
